

## **Javelina Software Announces the Release of ADtoolkit v4.0**

*ADtoolkit's new release streamlines Active Directory Administrators heavy work loads while providing AD and file share security reporting*

**(Edgewater, MD - 3.12.2007)** Javelina Software, LLC, announced today the release of ADtoolkit v4.0, the essential tool set for Active Directory administrators. ADtoolkit helps administer user, group, computer, contact, and security tasks, all with bulk task execution and streamlined configuration. By working closely with their customers, Javelina Software has refined ADtoolkit into a powerful product that has become a necessity for administrators striving to complete their daily tasks in Microsoft's Active Directory.

ADtoolkit v4.0, which now contains over 35 individual tools and scores of reports, has been greatly improved with the addition of dozens of customer requested enhancements. Some of the more notable enhancements include: security reporting, complex scheduling, multi-domain support, SMTP email support, PDF format for reports, auto-emailing of reports and output files, and numerous new reports for OUs, printers, local admins, locked out users, password expiration dates, logon hours, and much, much more.

ADtoolkit's new security reporting tools provide an in-depth look at the security of a network: the exact information needed to comply with government regulations such as HIPAA and Sarbanes-Oxley. Administrators can now report on Active Directory security, file and share security, as well as Exchange mailbox security, all with pre-configured reports. With these reports IT management can easily identify and address areas of risk.

The complex scheduling provided in this version of ADtoolkit allows Active Directory administrators to schedule tools or reports to run on a re-occurring basis – helping the administrator to keep up with employee changes that occur every day in business. For example, the HR department might update a file every time a new employee is hired. This data would then be imported by the Add Users tool, which was previously scheduled to run once an hour or once a day. Thus, new user accounts are created automatically and the Active Directory administrator needed only to schedule the process. The administrator has this burden lifted and is able to focus on more important tasks, the new employee is ready to get started, and the company just saved on manpower hours for the administrator and downtime for the new employee.

Javelina software continues to prove through ADtoolkit v4.0 that they are serious about streamlining Microsoft Active Directory's daily processes and providing administrators with the necessary tools to handle their growing business needs. "Our goal has always been to ease the Active Directory administrator from the burden of these time consuming tasks" states David

Ritchie, President of Javelina Software, "we listen to our customers and continue to enhance our product accordingly."

### **Pricing and Availability**

Available now, ADtoolkit is sold to enterprises using a per Administrator pricing model. This version is a no cost upgrade for all customers with a valid technical support contract. ADtoolkit v4.0 is available at \$1295 per admin copy. Volume discounts apply.

### **About Javelina Software**

Javelina Software is dedicated to delivering simplified management of Microsoft Active Directory. ADtoolkit (previously known as ADvantage) is an award-winning product that ensures expedient management of tasks essential to the administration of Active Directory (AD). ADxray® is the newest addition to Javelina Software's line of management solutions. Javelina Software's Migration Toolbox, the leading solution used by Banyan Vines customers who are migrating to Active Directory, shipped in 1999 and seamlessly migrates users, groups, and mailboxes. Migration Toolbox has since facilitated the rollouts of Active Directory implementations all over the world. And, Javelina Software's founding product, HappyMail®, is an e-mail client for Banyan Vines networks. Javelina Software now provides companies a smooth transition to and efficient administration of their Windows networks.
